

FEATURED ALUM-A-LIFT RACK-MOUNT SERVER INSTALLATION SYSTEM

PROJECT 27269

MODEL B350CS-96

FEATURING Low profile, rubber lined platform, 6° screw-operated tilt adjustment, and quick-exchange battery system

HANDLING 200 lb [91 kg] servers

DETAILS An enterprise server manufacturer required a lift to install rail-mounted components into server racks. These components feature small mounting studs which must be installed in a specific sequence, requiring the entire assembly to be angled when being aligned with the destination rails. An alternate lifting tool was currently in use, but was considered heavy and slow. This Alum-a-Lift provides safe, ergonomic, repeatable positioning using an integrated tilt module and the lift's standard fine vertical speed adjustment. The only complaint is that operators now fight over the "good" lifts!
